

Cloud Computing 5 years and beyond...

A seminar company was at the forefront of IT trends by spinning up their own private cloud using Co-Location Las Vegas.

This company had many offices throughout North America and needed a place to centralize their corporate email and their Critical Business Applications in a highly available and redundant manner. The seminar company placed their servers containing their email systems and their critical Line of Business Applications in our facility and connected all of their offices via a VPN. They created their own private cloud services to allow each one of their offices, their telecommuting employees and contractors access to the information they need. In addition they took advantage of Co-Location Las Vegas' managed infrastructure service to provide complete support to all of their offices and their cloud infrastructure. This allows them to save money on travel related expenses, to support their many locations and they were able to keep their internal IT Staff down to a bare minimum.
